

# Getting a video on the page

# Lecture CheckList

1. Introduction to HTML media
2. Importance of videos on webpages.
3. HTML Video tag

# Introduction to HTML media

Websites in the present-day scenario are not just built to showcase the content. Web developers and website owners want to make their websites more attractive and interactive. Considering this, the media in the websites are gaining popularity day by day. In Fact these days one of the most important things on the internet is the media.

# There are many potential uses for adding video to a website

1. Educational content
2. Marketing and advertising
3. Entertaining and engaging visitors
4. Providing customer support
5. Improving SEO

# To add a video to a web page, you can use the `<video>` element.

```
1 <video src="path/to/video.mp4" controls>
2   Your browser does not support the video tag.
3 </video>
```

You can also specify the width and height of the video using the width and height attributes.

```
1 <video src="path/to/video.mp4" controls width="600" height="300">
2   Your browser does not support the video tag.
3 </video>
```

You can also add multiple sources for the video using the `<source>` element, in case the browser does not support the first source.

```
1 <video controls width="640" height="360">
2   <source src="path/to/video.mp4" type="video/mp4" />
3   <source src="path/to/video.webm" type="video/webm" />
4   Your browser does not support the video tag.
5 </video>
```

# Attributes

- src :
- controls
- muted
- autoplay
- width
- height
