

# Font

# List of Concepts

1. Font color (Not Supported)
2. Font family
3. Font size
4. Font variant
5. Font weight

# Font

- Text appearance can be adjusted using the CSS Font attribute.
- Using the CSS font property, you can alter the text's size, color, style, and more. You've previously learned how to bold or underline text.

## These are some major font characteristics:

- **Font color:** The text's color can be altered with this property. (Standalone Attribute)
- **Font family :** This feature can change the font face.
- **Font size:** It is possible to change the font size with this feature.
- **Font design:** This setting is used to obliquely, boldly, or italicize the typeface.
- **Font-variant:** Small-caps effect is produced by this feature of the CSS font variant.
- **Font weight:** This attribute is used to modify the font boldness and lightness.

# Font Color

- Despite appearing to be a component of CSS fonts, CSS font colour is a separate attribute.
- It is used to alter the text's colour
- It can be specified as a color name, hexadecimal value or by RGB values

# Font family

The CSS font family is split into two categories:

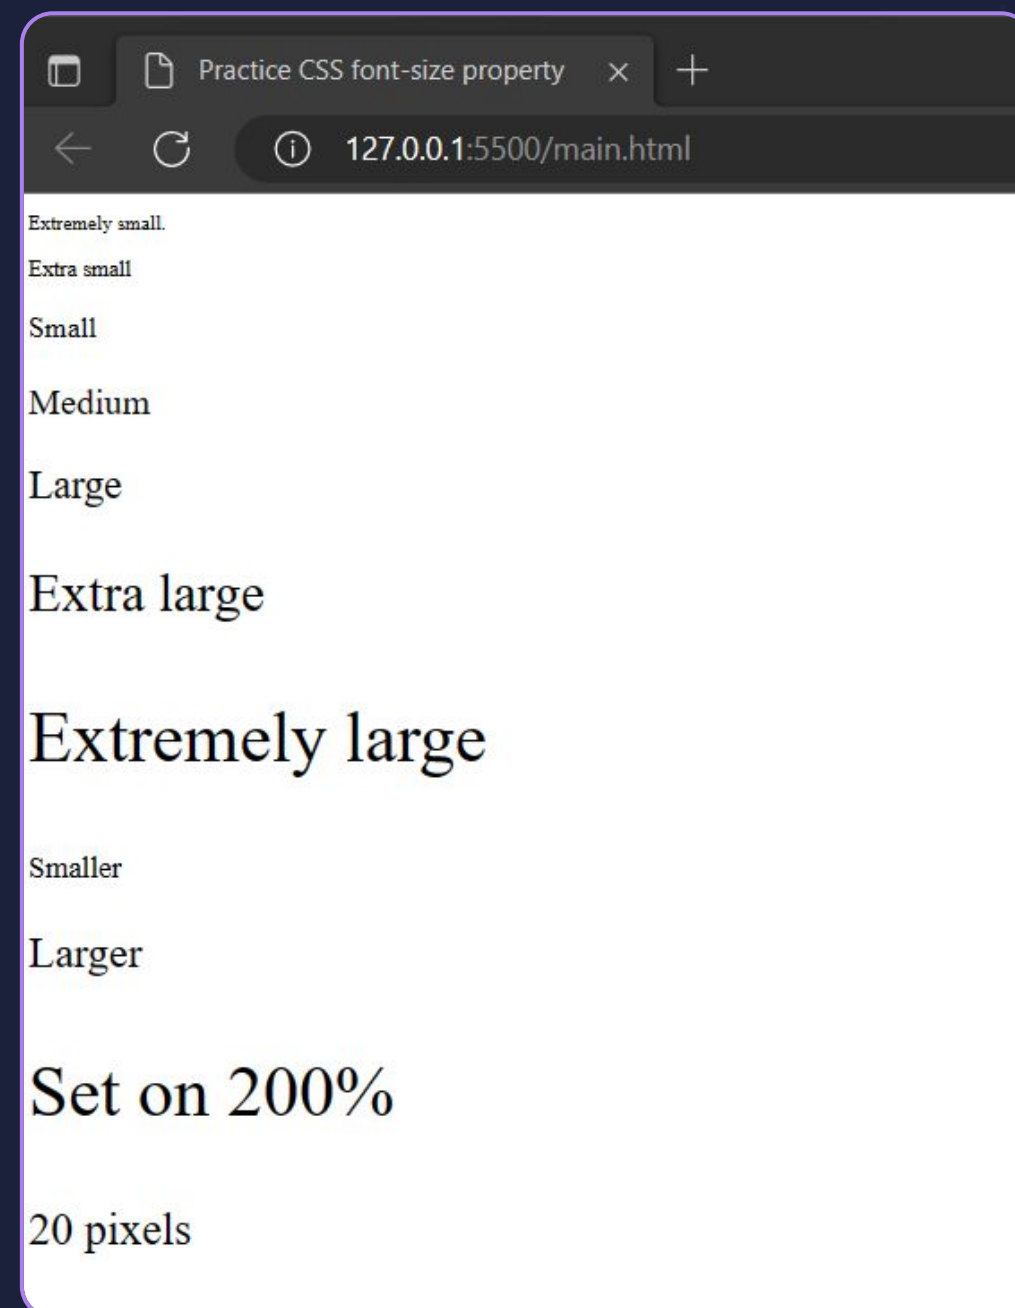

1. **Generic** : Its members include Monospace, Sans-serif, and Serif.
2. **Font family**: The name of the font family, such as Arial, New Times Roman, etc., is specified.

**Serif**: Fonts with serifs have little lines at the ends of the characters. Georgia, Times New Roman, and other serif font examples.

**Sans-serif**: Characters in a sans-serif typeface don't have little lines at the ends. Arial, Verdana, and other sans-serif font examples.

# Font size

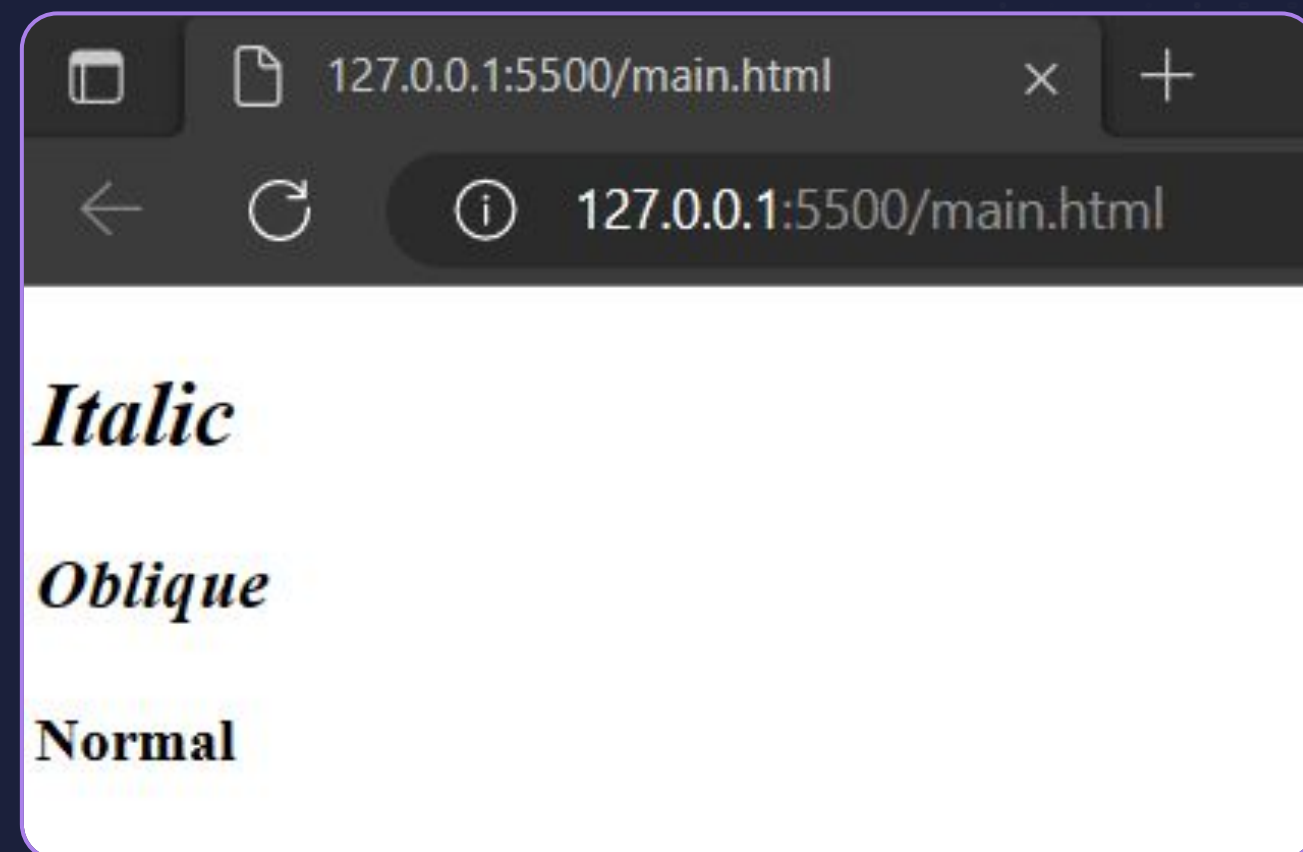

It is used to change the size of the font.

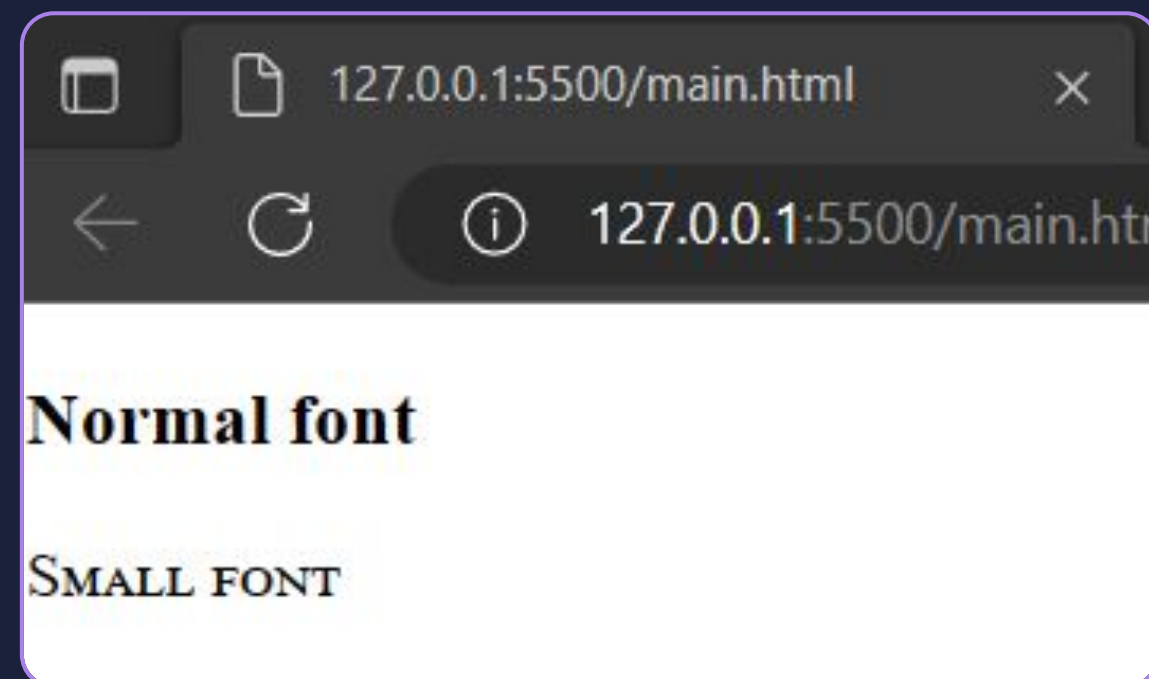

# Font Style

It may be italic, oblique, or normal.

# Font variant

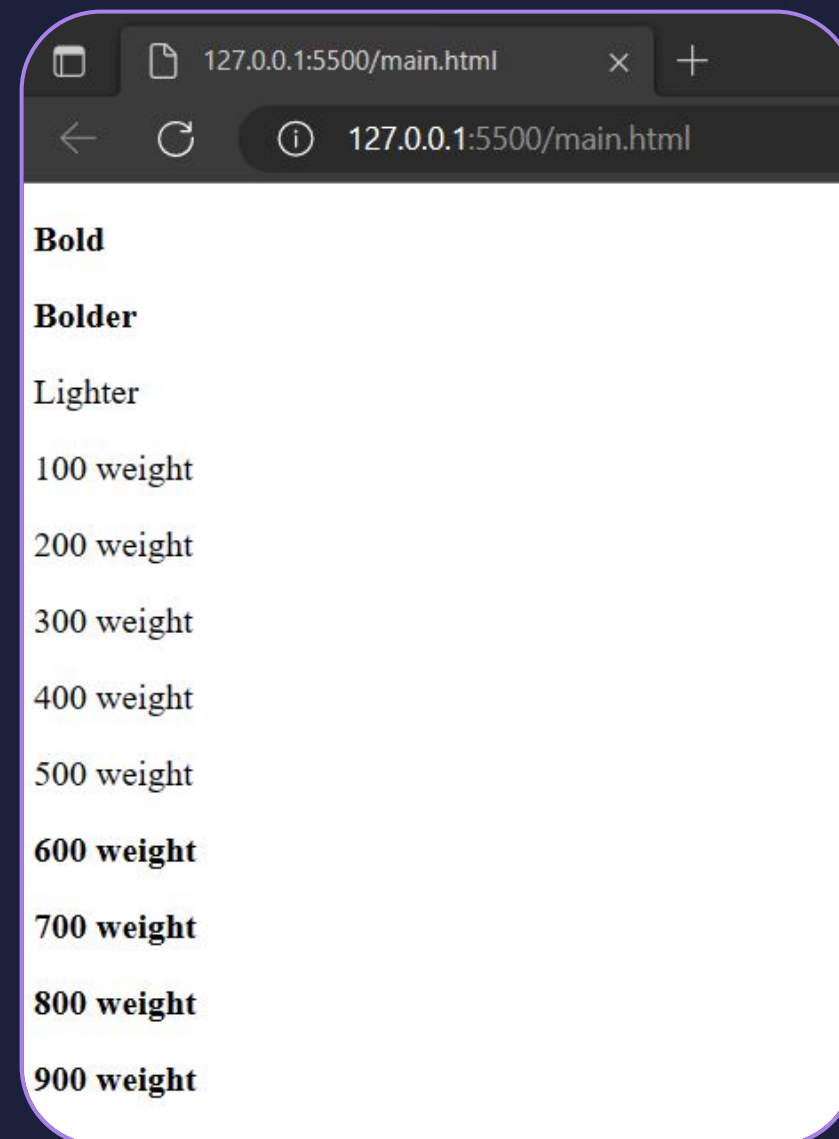

It may be normal and small-caps.

# Font weight

- The weight and boldness of a font are defined via the CSS font weight parameter.
- There are various font weight options, including regular, bold, bolder, lighter, and number (100, 200..... upto 900).
