3. Setters
4. Example

Getters

- In JavaScript, a getter is a special type of function that is used to get/retrieve the value of an object property.
- It allows you to define a method to be executed when a specified property is accessed

Example

Setters

- In JavaScript, a setter is a special type of function that is used to set the value of an object property.
- It allows you to define a method to be executed when a specified property is assigned a new value.
- To define a setter, you can use the set keyword followed by the property name, and then add a function that takes a single parameter representing the new value.
